Bladdernut (Staphylea trifolia)

Origin: Native.

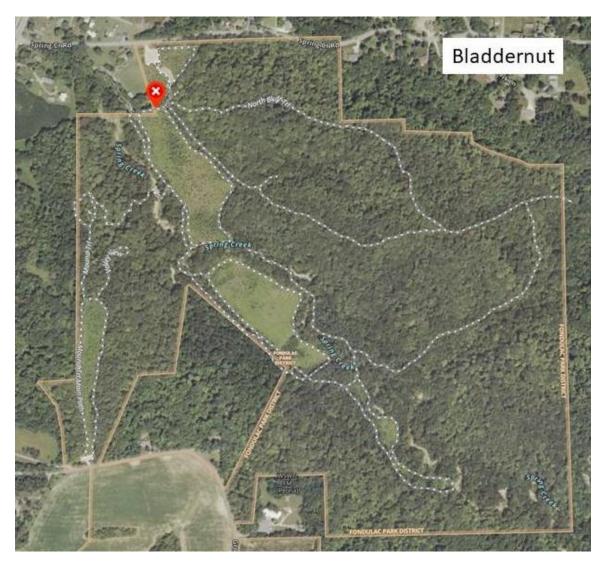

<u>Status in Park</u>: Occasional. Where present, grows in groups, spreading by root suckers. In moist woods and on field edges.

<u>Characteristics</u>: Reaches 20 feet tall, up to 4 inches in diameter; crown rounded; bark greenish in young trees, with mottled stripes, becomes gray to brown with age; flowers greenish white, about 3/8 inches long, in drooping clusters, April-May; fruits inflated, thin-walled capsules, green to yellowish brown, 1 to $2\frac{1}{2}$ inches long.

<u>Leaves</u>: Opposite, pinnately compound, with 3 leaflets 1 ½ to 4 inches long; edges with very fine teeth; dark green and smooth above, paler and slightly hairy below.

Location of tagged tree:

<u>Notes</u>: An attractive shrub of field edges and moist woods in the park. It has distinctive seed pods that give the plant its name.
